## What Multiple of Your Investment Do You Expect and In What Period? ${ }^{\circ}$

Arthur Lipper

Investors in royalties and other securities may describe investments they have made as the multiple of their original investment that was returned. This is often without regard to the time it took to achieve the result.

The more professional approach is to review investment success in terms of the Internal Rate of Return (IRR) achieved, which accounts for both time and multiple.

In the traditional approach, where an equity position is acquired at an initial valuation and the $n$ sold a number of years later, hopefully at a higher valuation, the IRR is calculated point-to-point. A 10 fold increase achieved after 10 ye ars yields a $25.9 \%$ IRR, according to industry-standard tables such as this one:

|  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| YEARS | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 2 | 41.4 | 73.2 | 100.0 | 123.6 | 144.9 | 164.6 | 182.8 | 200 | 216.2 |
| 3 | 26.0 | 44.2 | 58.7 | 71.0 | 81.7 | 91.3 | 100.0 | 108.0 | 115.4 |
| 4 | 18.9 | 31.6 | 41.4 | 49.5 | 56.5 | 62.7 | 68.2 | 73.2 | 77.8 |
| 5 | 14.9 | 24.6 | 32.0 | 38.0 | 43.1 | 47.6 | 51.6 | 55.2 | 58.5 |
| 6 | 12.2 | 20.1 | 26.0 | 30.8 | 34.5 | 38.3 | 41.4 | 44.2 | 46.8 |
| 7 | 10.4 | 17.0 | 21.9 | 25.8 | 29.2 | 32.0 | 34.6 | 36.9 | 38.9 |
| 8 | 9.1 | 14.7 | 18.9 | 22.3 | 25.1 | 27.5 | 29.7 | 31.6 | 33.4 |
| 9 | 8.0 | 13.0 | 16.7 | 19.6 | 22.0 | 24.1 | 26.0 | 27.7 | 29.2 |
| 10 | 7.2 | 11.6 | 14.9 | 17.5 | 19.6 | 21.5 | 23.1 | 24.6 | 25.9 |

The IRR calculation for a royalty investment is somewhat different from the traditional point-to-point approach, because a royalty measures a series of payments during the investment period, not just the the final one. In the following table, for 10 years of the 20
years of a $\$ 5$ million royalty investment, cumulative royalty payments are slightly over $\$ 50.0$ million in the $10^{\text {th }}$ year, yielding a 10x multiple. But the IRR for this series of payments is $48 \%$, because royalty payments by the $4^{\text {th }}$ year exceeded the amount invested and therefore the IRR became positive.

The point is this: a description of an overall royalty investment result should take into consideration the timing and amount of all interim payments.

It is possible for royalty investors and issuers to determine either agreed royalty payment terms or agreed minimum level royalty payment terms. This can be accomplished by using either a Royalty Satisfied Discount Obligation (RSDO) or by the royalty issuer agreeing to an annual minimum royalty payment.

An RSDO allows investors to pay a discounted amount in advance, in order to receive a projected series of royalty payments over a given time period.

The following table allows a user to enter the amount to be paid for a royalty, the number of years of royalty payment and the percentage of cost the royalty payments shall equal. The current features of the website calculators show a 10 times return. In the new and simplified calculator, the noted factors reflecting the cost, maturity and cumulative royalty payment will be calculated for an additional basis of negotiation between issuers and investors.

## Table to come
